**NEAREST AVAILABLE COPY**

apparatus 5A sends the various parameters held by the buffer memory emulator, to the wireless communication gateway server apparatus 5A of the request source. The wireless communication gateway server apparatus 5B 5 receiving the report of the various parameters with regard to the portable terminal 1 copies the received various parameters of the portable terminal 1 to the buffer memory emulator.

At this time, the portable terminal 1 is acquired 10 by the wireless telephony server apparatus 8, and the wireless telephony server apparatus 8 is cyclically connected to the wireless communication gateway server apparatuses 5A, 5B. Thus, it is possible to judge the terminal connected to the access point under the control 15 of each wireless communication gateway server apparatus. Hence, as compared with the case that the portable terminal moved to another cell is initialized by the wireless communication gateway server apparatus, in this method, the process in the buffer memory emulator can be continued 20 to thereby continue the services including the accounting process and the like. This results in the reduction in the time necessary for the connection process.

By the way, the above-mentioned embodiments, the HLR is used as the position information of the portable 25 terminal. However, the position information of the portable terminal may be grasped by using a geodetic satellite system and the like.
